Blood Bank Management System
IACSD (Institute for Advanced
Computing and Software
Development)

Project Title: **Blood Bank Management**

Project Advisor: **Prof. Mr.Milind Arjun**

Acknowledgement

Most importantly, our group sincerely thankful to our advisor Asst. Prof. Milind Arjun for giving us proper guidance to complete our senior project. Without his support we wouldn't be able to complete. Finally, we would like to give our special thanks to IACSD for giving us enough knowledge and skills that made us to innovatively and successfully research and compile this project.

1. Introduction

A blood donation is a process whereby a person voluntarily has blood drawn to be used for future transfusions when in need at hospitals for treatment procedures that require them. Donation may be of whole blood (blood drawn directly from the body) or of specific components of the blood; such as red blood cells, white blood cells, plasma, and platelets. Blood banks often participate in the process of collecting blood and other procedures such as managing stocks, approving blood requests and updating donation information.

The inspiration of this project is to improve blood banks in Thailand and to develop a blood bank information system which focuses on making an online system that is accessible for both donors and administrators. Donors can directly receive information regarding their previous blood donations, including their blood results and donation history, in order to easily schedule their next donations. They can also update the personal information through the system, without having to contact the blood bank registry.

The system is also developed for the administrators, who are the main authority in the system. Administrators can add, modify, delete, and query any donation

information if necessary. The administrator is also responsible for responding to the hospital's blood requests and checking the stocks in the blood bank's inventory.

2. Statement of the Problem

The following problem arises when using a typical blood bank's existing system:

- **Personal profile accessibility**

The donor's information can only be updated by the administrators of the blood bank. A donor can update their information by calling, faxing, e-mailing, but not by themselves. This is a waste of time just for updating a piece of information and it may be troublesome for some donors.

- **Lost or damaged card**

A typical membership card can easily get damaged if it is exposed to the sunlight or weather and this causes to ruin the card's barcode which is significantly important for retrieving records. If the card gets lost or stolen, the donor has to make a replacement card to keep their membership at the blood bank.

- **Donation record accessibility**

The donor ID card is the only tangible evidence that contains the donor's recent donation records, if the card gets lost, donors may find it difficult to schedule their next appointment since they are not able to see the last time they had donated blood.

- **Blood result notifications**

After the process of blood donation, the donor will receive a card that only contains their name and blood type. They will not be notified of their blood result unless they request that information from the blood bank.

- **Blood stock management**

Blood banks are required to maintain account of blood bags in the inventory. This increases with each blood donation recorded in our system, and decreases as they are checked out upon hospital requests. Our system will need to keep the information up-to-date to ensure correctness of the inventory.

- **Mailing by postal system**

Blood banks will only mail donors when the donated blood is disqualified, however, this mail is sent through the postal system to the donor's given address. If the donor's address is recorded incorrectly, the mail will be sent to the wrong address and the donor will never be notified that their blood is rejected and given the reason for that.

3. User Requirements

There are two internal users involved in this system. The user requirements are considered as follows:

Donor

1. To be able to view their donation records, including where and when they made donations, and the blood results for each, to learn of their donated blood quality and schedule their next donations.
2. To be able to view and update their personal information, including name, contact address, and phone number, to keep their donor's information record up-to-date with the blood bank.
3. To be notified of the blood results of their previous donation by e-mail, to know the success of their donation.

Administrator

1. To be able to create, update, delete, and query donor's records in order to manage donor information.
2. To be able to create, update, delete, and retrieve donation records to manage information about donations made.
3. To be able to deposit donated blood into inventory when donations are made.

4. To be able to withdraw blood from the inventory and keep a record of blood stocks to always keep count of the blood bags.
5. To be able to create, update, delete, and retrieve request records from hospitals to manage hospital requests for blood.
6. To be able to create, update, delete, and query hospital's records in order to manage hospital information.
7. To be able to send e-mails to donors for their user account and blood results through the system.
8. To be able to send e-mail responding to hospitals for their blood requests through system.

4. Objectives

The goal of the project is to develop a web application for blood banks to manage information about their donors and blood stock. The main objectives of this website development can be defined as follows:

1. To develop a system that provides functions to support donors to view and manage their information conveniently.
2. To maintain records of blood donors, blood donation information and blood stocks in a centralized database system.
3. To inform donors of their blood result after their donation.
4. To support searching, matching and requesting for blood convenient for administrators.
5. To provide a function to send an e-mail directly to the donor for their user account and the hospital, the availability of the blood bag.

5. Scope of the Project

The system functions and features of our system will include the following:

- **Registration**

This function allows the donor and administrator to register as a user to interact with the system. The system requires the user to login before viewing and editing any information.

- **View and edit information online**

Donors are allowed to view their blood donation records online by their given account. They can also edit their personal information through the system.

- **Data is input by the Administrators**

The donor's information and donation records can be sent from the hospital to the administrator by calling or e-mail. The administrator is responsible for keying the received data into the system.

- **Recording donation records**

The system is able to record data of whole blood which is sent from the hospital.

- **Manage blood inventory**

The system uses a First-In-First-Out stock management, where the blood stock that is checked-in to the system first will be the first one given to the hospital when requested. When the blood stock is expired, the administrator is responsible for removing the stock from the inventory and updating the system.

- **Blood requests**

The hospital can request blood via e-mail and by calling to the blood bank.

- **Notify by E-mail**

The donor's account and generated password will be sent via e-mail, following by their blood result of the previous donation sent in a separated e-mail. Hospitals can also receive e-mail responding to their requested blood whether it is available in our stock or not.

- **Summary report**

The system is able to generate a report to summarize all records including blood donation, blood requests and blood stock for the administrator.

6. Cost and Benefit Analysis

Benefits Analysis

1. Users do not have to contact the hospital to know the results of their blood donation. They can view their results through the website by logging-in with their username and password.
2. The reports and information are kept in electronic form and can be easily maintained by the administrators, and donors may access their donation records whenever they want to.
3. The reports of donations are kept in electronic files so that they may last longer and have less chance of being lost or damaged.
4. Administrators of the system can easily manage blood stock and blood withdrawals that have been requested by the hospitals.

7. Methodology

1. Project Identification and Selection

In this project, we aimed to develop an online blood bank system which will focus mainly on managing the donor's blood information. Anyone who is interested in blood donation can donate the blood at the hospital or blood donation centers.

2. Project Initiation and Planning

To begin the project, we have gather user requirement of this system and prepare the scope and objective. The results from this phase are scope and limitation, objectives, cost and benefits, feature of the proposed system and user interface design.

3. Analyzing System needs

We have studied and identified problems of existing system, then we develop data flow diagram for the existing system. We also develop data flow diagram (DFD) and entity relation diagram (E-R diagram) for the proposed system.

4. Designing the Proposed System

Based on the analysis phase, we converted E-R diagram into relational database model and created data dictionary and DFD and user interface are designed in this process.

5. Development of the Proposed System

In this phase, we are going to convert the design of proposed system to computer software, which includes computer programming using J2EE as a backend, Angular as a frontend, and MYSQL as a Database technology and translating the design specifications into the computer code.

6. Testing the Proposed System

This step is the process of testing whether the programming code will work correctly with the conditions in our system or not. In this phase, we will fix bugs in order to produce a system with maximum performance.

7. Implementing the Proposed System

We wish to launch this system on the internet, so that donors are able to view their blood donation records online and administrators can create, update, delete, and query records Conveniently

8. Analysis of the Existing System

There are two types of process in the existing system: the blood donation process by donors, and the blood request process by hospitals. In both processes, an administrator is in charge of managing the blood inventory in the blood bank.

Blood Donation Process by Donors

When a new donor comes to donate blood, they are required to fill out their personal information during the registration process before making a donation . After the donation, the donor is given a donor identification card with their name, blood type and a barcode to be used as a reference for future donations. The barcode is used to retrieve the donor's record containing their personal information, medical history and donation information, including blood results. Only blood bank administrators have the authority to access the donor's records, since the system is only available for their use within the organization. This makes it difficult for donors to make changes to their personal information within the system. That is, for donors to update their personal information, such as their phone number, mailing address, or e-mail, they cannot update the information by themselves, but have to contact the blood bank center to update their information

At the back the card is a table that contains number of donations, date, location, and the blood collector's signature. Existing donors can submit their donor ID cards to retrieve their personal information and donation records and start the blood donation process, and they will be given a new card after they have donated blood for a total of eight times. Having a donor ID card may be a tangible reminder to people that they are helping lives as a blood donor; however, possessing a physical card comes with

drawbacks such as loss or damage. To ensure donors can still identify themselves with the system, other credentials, such as username and password, can be used as a safeguard if their donor ID card is lost or damaged

If the donated blood is disqualified, the donor will be notified through postal mail that their blood component is reactive to viruses [4], meaning that there is a positive result of the blood being infected, and the organization will also inform the donor to perform another blood test at the blood bank to confirm the result of blood. If the blood is qualified, the administrator then will deposit the blood into the inventory for future requests.

Blood Request Process by Hospitals

Hospitals can request for blood by calling in or e-mailing the blood bank the type of blood and the quantity that is in need. The administrator is responsible in checking the availability of the blood type according to the request. If the requested blood type is available, the administrator will withdraw the blood from the inventory and transfer it to the hospital. However, if the requested blood is unavailable, the administrator will send an e-mail to inform the hospital.
